## Screens with elliptic oscillation EDT

### **SCREENING**

Screen EDT2N2160/2PU positioned on a pontoon – wet screening of gravel from the seabed

Workshop tuning of the screen EDT2N2160/2PU

#### They are light screens of many alternatives:

- EDT and EDTN opened screen, single drive
- 2. EDT2N opened screen, two drives
- 3. EDTN...K closed screen, single drive
- 4. EDT2N...K closed screen, two drives
- 5. EDT2N...K-st.°C closed screen, two drives for screening at higher temperatures

# Screens with elliptic oscillation EDT

The screens are used for middle and final screening. They are mostly two-deck ones exceptionally three-deck units. They are supported, on request suspended. They work with inclination from 0° (two-drive units) up to 20° (single-drive machines). An ordinary steel mesh longitudinally tensioned (approx. up to 1 m wide and 2 m long) or transversally tensioned mesh is usually used. PU module screens may also be used.

Covers of closed screens are integrated as part of the machine. Covers are module (with a module 500 mm) and with a hole for venting connection. Hoppers of these screens are equipped with a flange for screwing and outlet flange for sealing by pressing.

The cover of screens for screening hot material is exchanged for a heat shield.

With all machines EDT the driving unit is designed so that it could be moved in the housing and the screening capacity could be optimized.

| Machine type:  |       | Area   | a 4)    |       | Max. inlet    | Screening<br>limits | Max.<br>capacity | Installed   |  |  |
